### IN THE CLAIMS

Please reconsider the claims as follows:

1. (currently amended) A method for monitoring, from a remote location comprising a monitor and control unit, operations of a head-end in an information distribution system, the method comprising:  
    ~~at the remote location,~~ receiving at the monitor and control unit status from the head-end relating to ~~one or more~~ operations performed at the head-end;  
    receiving identities of a plurality of ~~one or more~~ remote devices designated to receive status from the head-end via the monitor and control unit;  
    receiving an indication of capabilities of each remote device of the plurality of remote devices designated to receive status; and  
    forwarding at least a subset of the received status from the monitor and control unit ~~remote location to the plurality of one or more~~ remote devices, wherein status are forwarded to each remote device of the plurality of ~~one or more~~ remote devices in conformance with the indicated capabilities;  
    receiving a response message from a particular remote device; and  
    forwarding the response message to the head-end wherein the received response message from the particular remote device includes a command to adjust at least one parameter of a particular operation performed at the head-end.
2. (original) The method of claim 1, further comprising:  
    receiving indications of possible error conditions relating to the one or more operations; and  
    forwarding one or more alert messages to the one or more remote devices in response to receiving the indications.
3. (currently amended) The method of claim 1, further comprising:  
    polling ~~the~~ a plurality of head-ends for status relating to the operations of each head-end.
4. (canceled)

5. (canceled)

6. (original) The method of claim [[5]]1, wherein the indicated capabilities for each remote device is indicated as text, graphics, or a combination thereof.

7. (original) The method of claim [[4]]1, further comprising:  
receiving an indication of a particular reporting level for each remote device designated to receive status, and  
wherein status are forwarded to each of the one or more remote devices in conformance with the indicated reporting level.

8. (canceled)

9. (canceled)

10. (previously presented) The method of claim 1, wherein the received status includes status relating to encoding operations performed at the head-end.

11. (previously presented) The method of claim 10, wherein the status relating to the encoding operations includes status for one or more buffers used to store encoded data at the head-end.

12. (previously presented) The method of claim 1, wherein the received status includes status relating to multiplexing operations performed at the head-end.

13. (previously presented) The method of claim 1, wherein the received status includes status relating to a particular transport stream transmitted from the head-end.

SN 09/734,496  
Page 4 of 10

14. (original) The method of claim 1, wherein the received status include bit rates for a plurality of types of data being provided from the head-end.

15. (currently amended) The method of claim 1, wherein at least one of the ~~one or more~~ plurality of remote devices is a pager.

16. (currently amended) The method of claim 1, wherein at least one of the ~~one or more~~ plurality of remote devices is a cellular telephone.

17. (currently amended) The method of claim 1, wherein at least one of the ~~one or more~~ plurality of remote devices is a wireless device.

18. (original) The method of claim 2, wherein the status and messages are forwarded via a standard messaging protocol.

19. (currently amended) A method for monitoring, from a remote location, operation of a head-end in an information distribution system, the method comprising:  
at the remote location, receiving information from the head-end relating to one or more operations performed at the head-end, wherein the received information includes status and indications of possible error conditions relating to the one or more operations performed at the head-end;

receiving, at the remote location, identities and indications of capabilities of one or more remote devices designated to receive the information relating to the one or more operations performed at the head-end; and

forwarding at least a subset of the received information from the remote location to the one or more remote devices in conformance with the indicated capabilities;

receiving a response message from a particular remote device; and  
forwarding the response message to the head-end wherein the received response message from the particular remote device includes a command to adjust at least one parameter of a particular operation performed at the head-end.

SN 09/734,496

20. (currently amended) A method for remotely monitoring and controlling operation of a head-end in an information distribution system, comprising:

maintaining identities and indications of capabilities of one or more remote devices designated to receive information relating to one or more operations performed at the head-end;

providing, from a remote location to one or more remote devices, status from the head-end relating to one or more operations performed at the head-end in conformance with the indicated capabilities;

receiving, at the remote location, from a particular remote device one or more response messages; and

adjusting at least one parameter of a particular operation performed at the head-end in accordance with the one or more response messages.

21. (original) The method of claim 20, further comprising:

providing to the one or more remote devices indications of possible error conditions relating to the one or more operations performed at the head-end.
